

## Amendments to the Claims

1. (Currently amended) A motor ~~having~~ comprising a motor portion  
and a gear housing integrally assembled together with ~~[[a]] the~~ motor portion,  
5 ~~wherein the gear housing encloses~~ enclosing a speed-reduction mechanism for  
reducing a rotational speed of the motor portion ~~and receives~~ , receiving a  
circuit board therein, the motor characterized and having:

~~in that the gear housing has:~~

an opening portion facing the motor portion;

10 a board-installing portion to hold the circuit board inserted through  
the opening portion and along an axial direction defined along a center of the  
motor portion; and

a cover member to block the opening portion, and

15 ~~[[ia]]~~ further comprising a restriction member fixed inside of the opening  
portion and restricting the circuit board from moving to a counter-insertion side  
thereof in the axial direction, the restriction member is installable at a  
predetermined position in which the restriction member is limited from  
contacting with the cover member in the axial direction.

20 2. (Original) The motor according to the Claim 1, wherein:

the gear housing is formed in a planiform shape; and

a direction of a plane of the circuit board is disposed along a planiform  
direction of the gear housing.

3. (Original) The motor according to the Claim 2, wherein the restriction member is disposed at approximately center portion of the circuit board in the planiform direction of the gear housing.

5 4. (Currently amended) The motor according to ~~any one of Claims 1 to 3~~  
Claim 1, wherein:

the gear housing is provided with a first attachment portion and a second attachment portion to interpose the circuit board therebetween in a direction perpendicular to a direction of a plane of the circuit board; and

10 the restriction member is fixed to span a clearance between the first attachment portion and the second attachment portion.

5. (Currently amended) The motor according to ~~any one of Claims 1 to 4~~  
Claim 1, wherein the restriction member has a holding portion holding the circuit  
15 board in a direction perpendicular to a direction of a plane of the circuit board.

6. (Original) The motor according to Claim 5, wherein the restriction member is formed to have an elastic force at least in the direction perpendicular to the direction of the plane of the circuit board and attached to the gear  
20 housing to generate the elastic force.
